Two pictures.

Not abelian. *why?*

3

- a. V . ✓
- b. R_{270} . ✓
- c. R_0 . ✓
- d. $R_0, R_{180}, H, V, D, D'$. ✓
- e. None. ✓

We follow our intuition and generalize the cases of D_4 and D_3 with no formal argumentation.

For both cases, Elements include rotations $\frac{i}{n}360$ for $i = 1, 2, \dots, n - 1$. Counts n .

Even case only. Flips about the i th diagonal (counts $n/2$), and Flips about the i th axis (counts $n/2$)

Odd case only. Flips about the i th diagonal (counts n). not a diagonal

D_n is going to have a total of $2n$ elements; This fact was mentioned in the textbook though.

Notation. We denote *Rotation* by T and *Reflection* by F .

Lemma. Through Cayley table in page 33, $TT = T$, $FF = T$, $TF = F$, and $FT = F$.

In other words $X^2 = T$, and $XY = F$ if $X \neq Y$, if they are not both a rotation or reflection

Theorem. Observe we can re-structure the given composed function as $a^2b^2b^2acc^2c^2a^2ac = TTTacTTTac = (TTTac)^2 = T$.

Therefore, Regardless of the choices of a, b, c , The given function is always a *rotation*.

$$D = HR_{90} = R_{90}V.$$

21

$X \neq H, V, D, D', R_0, R_{180}$, As otherwise $X^2 = R_0$ and then $Y = R_{90}$. For either of the remaining two cases $X = R_{90}$ or $X = R_{270}$, Necessarily $Y = R_{270}$.
